

Isansys Lifecare Exhibits at the Health and Care Innovation Expo 2018

Isansys to showcase its next generation of wearable technology and wireless patient monitoring platform in Manchester next month

Oxford, August 3, 2018 – Isansys Lifecare, a new generation digital healthcare company, will showcase its world leading advanced patient monitoring system at the Health and Care Innovation Expo next month.

Isansys has created the Patient Status Engine, an innovative next-generation all wireless patient monitoring platform which collects and analyses real-time vital sign data to provide current and future views of a patient's status. Consequently the PSE can alert care teams to early signs of deterioration in patients allowing them to take timely preventative measures.

At the event, which runs from the 5th to the 6th September 2018 at Manchester Central, representatives of the company will be on hand to discuss the system and how this state-of-the-art technology is increasing efficiencies in healthcare and improving patient outcomes.

Keith Errey, CEO of Isansys, says: "There is a body of evidence that improved monitoring of patients in both acute and non-acute care settings improves patient safety. In the UK, reviews of case records have shown that last year there were 1.2 million reported care incidents, and, in 2013, there were 850,000 reported inpatient adverse events resulting in £2.5 billion in additional bed days alone. Total costs of patient safety, including £1.2 billion in litigation payments and fees, are around £5 billion. Other costs, such as suffering of patients, their families, and the health workers involved, are incalculable.

"Despite directives from politicians and managers, and the genuinely good work of healthcare professionals the figures above highlight that the need for better monitoring of patients is more urgent than ever before.

"We are hoping that by showcasing the Patient Status Engine, which generates new clinical insights, predicts patient trajectories and detects signs of deterioration hours before an event occurs, we can prove more can be done now to help clinicians and nurses recognise signs of deterioration earlier; improving patient outcomes, reducing healthcare associated costs, shortening hospital stays, and facilitating proactive care."

If you would like to find out how you can develop new care methods and improve patient outcomes, whilst reducing healthcare costs, please email us info@isansys.com or come and meet a member of the team at the Innovator Zone.
